Wind Turbine Drivetrain Technology, Operations, and Maintenance

- NREL develops and verifies advanced drivetrain concepts and innovative bearing, gearbox, and generator technologies.
- We lead the Drivetrain Reliability Collaborative to increase drivetrain reliability and turbine availability through improved designs and prognostic technology, thereby reducing operations and maintenance costs.

Areas of Expertise

- Drivetrain innovation
- Drivetrain modeling, analysis, and validation
- Prognostics and health management
- Reliability, operations, and maintenance

Drivetrain Reliability Research

- Predominant failure modes ***generally are not***:
 - Accounted for in design standards or predicted by life models
 - Specific to a supplier or due to manufacturing or material quality.
- Need for research to characterize failure modes and:
 - Increase reliability and life (coatings, additives, lubricants, designs, controls)
 - Predict remaining useful life and increase availability
 - Reduce drivetrain O&M costs.

Rotor pitch
(nodding) moment

Rotor yaw moment

Epicyclic Load Sharing

- Ideally, all gears transmit equal torque
 - Manufacturing errors create unequal loads
 - Floating central member can compensate
- Singh previously developed an analytic model for load sharing
- This work validates the Singh model that was reformulated for horizontally mounted gearboxes subjected to nontorque loads

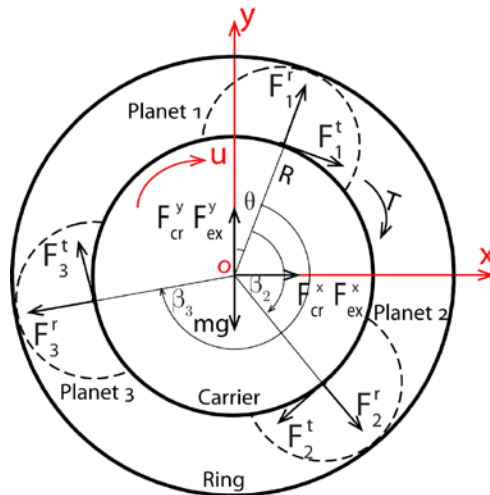

Epicyclic Load-Sharing Model

- Planetary mesh load factor (K_γ)
 - Actual load/ideal load
 - Varies once per revolution
 - Maximum value (K_γ^*) examined

For a 3-planet floating system:

$$K_\gamma^* = 1 + \frac{K_m \delta_{rp}}{T/3R} + \frac{2R \sqrt{(F_{ex}^x + F_c^x)^2 + (F_{ex}^y + F_c^y - mg)^2}}{T}$$

T Torque

R Center radius

$K_m \delta_{rp}$ Mesh force

F_{ex} External force from rotor moment

F_c Carrier bearing reaction, if in contact, depending on clearance Δ_c

mg Equivalent system weight

Dynamometer Validation

- Full 750-kilowatt wind turbine drivetrain, 2 different gearboxes
- Calibrated strain gauges on planet bearing inners
- Applied nontorque loads with hydraulic actuators
- Measured planet bearing loads and other parameters

Load-Sharing Factors

Gearbox with CRBs

Assumed $\Delta_c = 275 \mu\text{m}$

Gearbox with TRBs

Carrier Bearing Clearance

Gearbox with CRBs

Model does not include preload

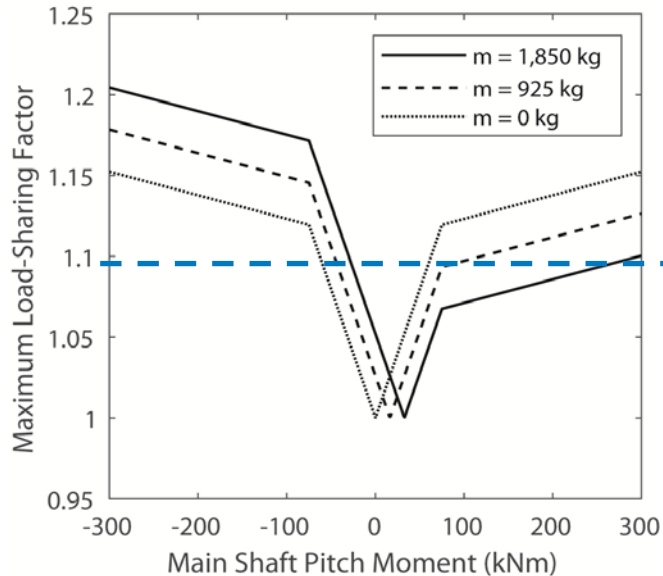

Difficult to determine carrier bearing operational clearance (Δ_c) for full complement bearings

Load sharing sensitive to Δ_c

Reducing clearance improves load sharing

Planetary System Mass

Gearbox with CRBs

Design K_γ

Lightweighting improves load sharing

Gearbox with TRBs

Lightweighting has no effect

Summary and Conclusions

- Validated load-sharing model for horizontal gearboxes
 - Accounts for nontorque loads, gravity, and clearance
- Equal load sharing cannot generally be achieved
 - With zero nontorque load $K_{\gamma}^* = 1.08$
- Carrier bearing clearance has strong influence on load sharing
- Equivalent system weight only influences load sharing for systems with clearance
